Abstract The purpose of this study was to determine whether there were differences in the prevalence of self-reported depression between men and women who had been exposed to violence during childhood and adulthood. Data from the National Longitudinal Study of Adolescent Health (*N = 9,800*) were used to examine the association between exposure to violence and self-reported depression among adolescents aged 15–17 years. Results showed that exposure to violence during childhood and adulthood was associated with higher rates of self-reported depression. Furthermore, the association between exposure to violence and self-reported depression was stronger for females than males.

Figure 1: Schematic representation of the experimental design. The diagram shows a sequence of events: a subject is presented with a stimulus (a word), then a response is generated (a word), and finally a feedback is provided (a word). The sequence is repeated for multiple trials. The diagram is divided into three main sections: 'Stimulus', 'Response', and 'Feedback'. Each section contains a list of words. The 'Stimulus' section lists words like 'cat', 'dog', 'bird', 'fish', 'insect', 'mammal', 'reptile', 'amphibian', 'bird', 'fish', 'insect', 'mammal', 'reptile', 'amphibian'. The 'Response' section lists words like 'cat', 'dog', 'bird', 'fish', 'insect', 'mammal', 'reptile', 'amphibian'. The 'Feedback' section lists words like 'cat', 'dog', 'bird', 'fish', 'insect', 'mammal', 'reptile', 'amphibian'. The diagram also shows a 'Correct' and 'Incorrect' feedback path.
